

Using lightweighted environment template (use)

Download of lightweighted environment template

When the template source is being downloaded with the development environment tool for developer (the eclipse in which the plugin for eGovFrame is embedded.), it can be seen as the state of being downloaded with the template source for home page, business system, and portal site.

The source of each template can easily be confirmed through the template project generation menu of the development tool, and it can immediately be executed after generating the table for test (using table generation script of the database folder included in the project source).

For template menu generation function, refer to the manual of the development environment tool.

Template using procedure of the development environment tool

1. Installation of development environment

Download the development environment tool for developer from eGovFrame and install it. ([shortcut to download of the development environment tool and installation method](#))

⇒When there is no test DB environment, conduct HSQL DB download (If runHsqlDB.cmd is executed after releasing compression, home page template test can be performed.): [Download](#)

2. Generation of template project (using template generation menu)

Generate development environment template project through template generation menu of development environment tool. ([shortcut to the template project menu using method](#))

3. Execution of development environment project

Confirm the menu configuration and function description of the template project. ([shortcut to the lightweighted environment template basic function description](#))

4. Development environment project environment setup Confirm the menu configuration and function description of template project. ([shortcut to the lightweighted environment template environment setup](#))

5. Reference items related with basic functions of homepage template

- Changing the administrator password of the home page template

The user information change function is not included in the home page template, therefore, if change is required, it shall directly be changed from DB.

When password is to be changed, JSP page for password change can be used by downloading it. (Perform execution after saving at the identical location as index.jsp)

(password change JSP [download](#))

- Changing the menu configuration of portal site template

The program change function is not included in the portal site template, therefore, if change is required, it shall directly be changed from DB.

Menu configuration of portal site template can be confirmed through program list information (LETTNPROGRMLIST) and menu (LETTNMENUINFO).

The menu which can be seen during login shall actually be configured through the menu list information for each authority located at the menu generation information (LETTNMENUCREATDTLS). If required, it can generally be re-configured and reflected to DB through editing work by referring to attached Excel file.
